How to create a LaTeX document from a Maxima script

Richel Bilderbeek

December 14, 2014

Abstract

This article is created within the CAS program Maxima and shows (1) algebraic differentiation (2) plotting, and (3) listings. This article is self-containing: it can be recreated from the listings it contains. The article itself is intended to be of publishable quality, having (1) an abstract (2) a bibliography.

1 Introduction

LaTeX is commonly used for writing publishable scientific articles[1]. Algebraic manipulations can be done by a CAS, for example Maxima, Maple or Mathematica. Of these examples, Maxima is the only free and open-source program. This article is an example of writing a LaTeX article within Maxima

2 Materials and methods

A script executes the process from Maxima file to LaTeX-formatted document in two steps. The first step executes the Maxima script to create a LaTeX (.tex) file. The second step converts the LaTeX file to Portable Document Format (.pdf). The script does not require user intervention.

The Maxima script consists out of two parts: algebraic manipulations and LaTeX output

The algebraic manipulations demonstrated are: (1) defining a function (2) calculate its derivative and, (3) plot this derivative.

The second part uses these algebraic results to create a LaTeX (.tex) file. It creates an article displaying the formula's, the single plot in the Results section. In the Appendix, it shows: (1) the bash script to create a PDF from the Maxima script (2) the Maxima script (3) the generated LaTeX code

3 Results

Equation $f(x)$ used:

$$f(x) = x^3 + 2x^2 + 3x + 4$$

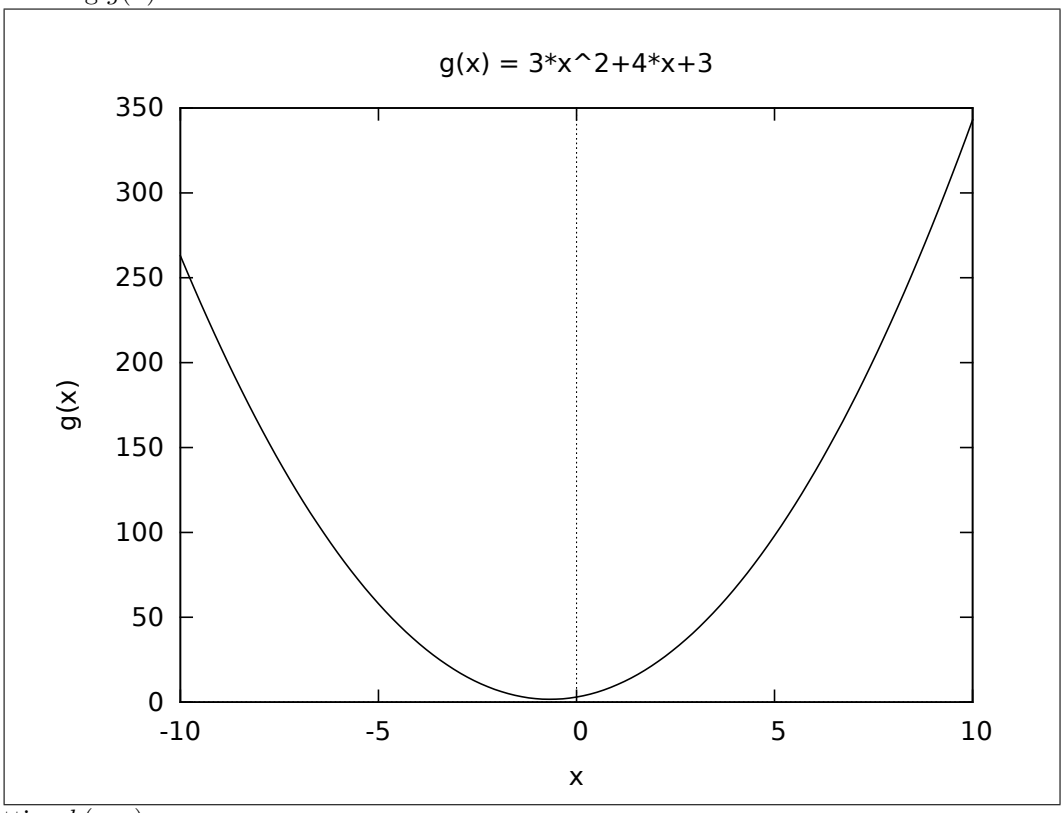
Equation $g(x)$ is the derivative of $f(x)$ with respect to x:

$$g(x) = 3x^2 + 4x + 3$$

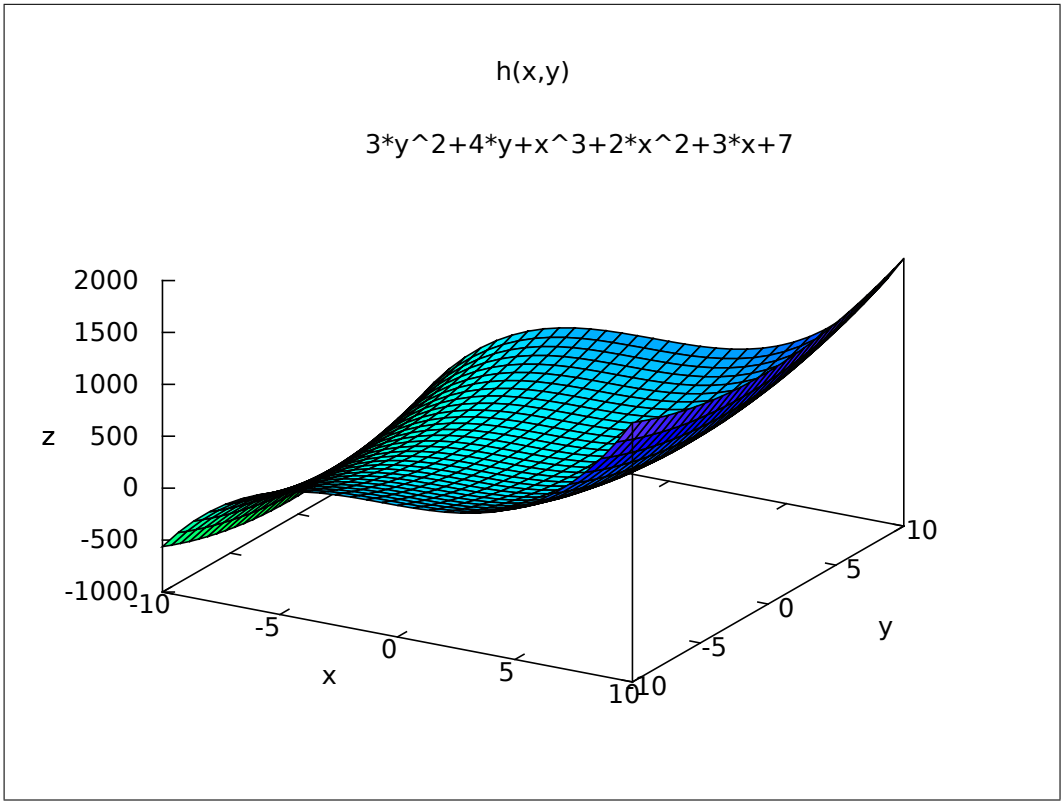
Equation $h(x, y) = f(x) + g(y)$, which equates to:

$$h(x, y) = 3y^2 + 4y + x^3 + 2x^2 + 3x + 7$$

Plotting $g(x)$:



Plotting $h(x, y)$:



4 Discussion

Writing LaTeX within Maxima can be done, but it is a bit cumbersome: Maxima does not know LaTeX syntax and just creates contextless strings, which might not be compilable by LaTeX. However, because the script does create a .tex file, this file can be inspected easily with a LaTeX tool like texmaker.

\title{How to create a \LaTeX~document from a Maxima
    script}
\author{Richel Bilderbeek}
\date{\today}

\begin{document}

\maketitle

\begin{abstract}
```

```
This article is created within the CAS program Maxima
and shows (1) algebraic differentiation (2) plotting, and
    (3) listings.
This article is self-containing: it can be recreated from
    the listings it contains.
The article itself is intended to be of
publishable quality, having (1) an abstract (2) a
   bibliography.
\end{abstract}

\section{Introduction}

\LaTeX~is commonly used for writing publishable
   scientific articles\cite{gaudeul2006}.
Algebraic manipulations can be done by a CAS, for example
    Maxima, Maple or Mathematica.
Of these examples, Maxima is the only free and open-
   source program.
This article is an example of writing a \LaTeX~ article
   within Maxima

\section{Materials and methods}

A script executes the process from Maxima file to \LaTeX-
   formatted document in two steps.
The first step executes the Maxima script to create a \
   LaTeX~(.tex) file.
The second step converts the \LaTeX~file to Portable
   Document Format (.pdf).
The script does not require user intervention.

The Maxima script consists out of two parts:
algebraic manipulations and \LaTeX~output

The algebraic manipulations demonstrated are:
(1) defining a function
(2) calculate its derivative and,
(3) plot this derivative.

The second part uses these algebraic results to create a
   \LaTeX~(.tex) file.
It creates an article displaying the formula's, the
   single plot in
the Results section.
In the Appendix, it shows:
```

```
(1) the bash script to create a PDF from the Maxima
    script
(2) the Maxima script
(3) the generated \LaTeX~code

\section{Results}

Equation $f(x)$ used:

$$f\left(x\right)=x^3+2\,x^2+3\,x+4$$

Equation $g(x)$ is the derivative of $f(x)$ with respect
    to $x$:

$$g\left(x\right)=3\,x^2+4\,x+3$$

Equation $h(x,y) = f(x) + g(y)$, which equates to:

$$h\left(x\ ,\ y\right)=3\,y^2+4\,y+x^3+2\,x^2+3\,x+7$$

Plotting $g(x)$:

\fbox{\includegraphics[scale=0.8]{/home/richel/GitHubs/
    Maxima/create_tex_article_output_plot2d.pdf}}
Plotting $h(x,y)$:

\fbox{\includegraphics[scale=0.8]{/home/richel/GitHubs/
    Maxima/create_tex_article_output_plot3d.pdf}}

\section{Discussion}

Writing \LaTeX~within Maxima can be done, but it is a bit
     cumbersome:
Maxima does not know \LaTeX~syntax and just creates
    contextless strings,
which might not be compilable by \LaTeX.
However, because the script does create a .tex file,
this file can be inspected easily with a \LaTeX~tool like
     texmaker.
